Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

Claim 1 (currently amended): A method for producing a light guide plate, comprising the steps of:

- providing a molding machine comprising an injection machine and a mold, the mold comprising a first plate having a side wall and a second plate having a side wall opposite to the first plate, wherein the side wall of the first plate faces the side wall of the second plate in a non-parallel manner, and a cavity is formed between the first plate and the second plate, the cavity having one of a wedge shape and a papilionaceous shape in cross-section, the cavity communicating with a cylinder of the injection machine;
- feeding a transparent resin into the cylinder;
- melting the resin in the cylinder; and
- rejecting the molten resin from the cylinder into the cavity of the mold; and
- cooling the molten resin so that it solidifies by means of a refrigerant filled in a fluid passageway, wherein the fluid passageway ~~that~~ is provided in the first plate and is arranged in a plane non-parallel with the side wall of the first plate and parallel with ~~parallel to~~ the side wall of the second plate;
- wherein a viscosity of the molten resin at an inlet of the mold is in

Reply to Office Action of October 3, 2006

the range from about 200 to about 1,000 Pa.sec, and an injection rate of the molten resin is in the range from about 1,000 to about 2,500 cm³/sec.

Claim 2 (original): The method for producing a light guide plate as claimed in claim 1, wherein the resin is methyl methacrylate resin.

Claim 3 (original): The method for producing a light guide plate as claimed in claim 1, wherein the temperature of the resin in the cylinder is set in the range from about 170 to about 300 °C.

Claim 4 (original) The method for producing a light guide plate as claimed in claim 1, wherein the temperature of the resin in the cylinder is set in the range from about 190 to 270 °C.

Claim 5 (original): The method for producing a light guide plate as claimed in claim 1, wherein the temperature of the resin in the cylinder is set in the range from about 230 to about 260 °C.

Claim 6 (original): The method for producing a light guide plate as claimed in claim 1, wherein a viscosity of the molten resin at the inlet of the mold is in the range from about 50 to about 5,000 Pa.sec.

Claim 7 (original): The method for producing a light guide plate as claimed in claim 1, wherein the molten resin is continuously injected into the cavity with rotation of a screw in the cylinder.

Claim 8 (currently amended): The method for producing a light guide plate as claimed in claim 1, wherein an engraved pattern is provided on [[a]] the side wall of the first plate or the side wall of the second plate, in order to provide the obtained light guide plate with a corresponding pattern of dots.

Claim 9 (currently amended) The method for producing a light guide plate as claimed in claim 1, wherein an engraved pattern is provided on a cavity plate that is attached on [[a]] the side wall of the first plate

Appl. No. 10/749,045

or the side wall of the second plate, in order to provide the obtained light guide plate with a corresponding pattern of dots.

Claim 10 (currently amended): A mold for producing a light guide plate, comprising:

a first plate having a side wall;

a second plate having a side wall opposite to the side wall of the first plate, the side wall of the second plate being non-parallel to the side wall of the first plate;

a cavity for molding a light guide plate defined between the first plate and the second plate, the cavity having one of a wedge shape and a papilionaceous shape in cross-section; and

a fluid passageway provided in the first plate for cooling and solidifying molten resin injected into the cavity;

wherein the fluid passageway is arranged in a plane non-parallel with the side wall of the first plate and parallel with parallel to the side wall of the second plate.

Claim 11 (original): The mold for producing a light guide plate as claimed in claim 10, wherein a fluid passageway is provided in the second plate, parallel to passageway of the first plate.

Claim 12 (original): The mold for producing a light guide plate as claimed in claim 10, wherein the cavity is wedge-shaped.

Claim 13 (original): The mold for producing a light guide plate as claimed in claim 10, wherein the cavity has a papilionaceous shape in cross-section.

Claim 14 (original) The mold for producing a light guide plate as claimed in claim 10, wherein the mold is made of copper or a copper alloy.

Claim 15 (original): The mold for producing a light guide plate as claimed in

Appl. No. 10/749,045
Amdt. Dated January 2, 2007
Reply to Office Action of October 3, 2006

claim 14, wherein a material of the mold is mixed with any one of Ni, NiCo, NiP, SiC, Cr and TiC.

Claim 16 (currently amended): The mold for producing a light guide plate as claimed in claim 10, wherein an engraved pattern is provided on [[a]] the side wall of the first plate or the side wall of the second plate.

Claim 17 (original): The mold for producing a light guide plate as claimed in claim 10, further comprising a cavity plate attached on the side wall of the first plate or the second plate, the cavity plate having an engraved pattern provided thereon.

Claim 18 (original): The mold for producing a light guide plate as claimed in claim 16, wherein the pattern comprises a plurality of concavities.

Claim 19 (original) The mold for producing a light guide plate as claimed in claim 17, wherein the pattern comprises a plurality of concavities.

Claim 20 (original): A method for making a light guide plate comprising:
providing a mold including opposite first and second plates wherein the first plate defining a non-oblique side wall and said second plate defining an oblique side wall spatially facing to each other and commonly defining a cavity therebetween for forming said light guide plate; and
providing said second plate with a plurality of cooling fluid passageways adjacent to said oblique side wall under a condition that
said plurality of passageways are arranged in a plane with regard to the oblique side wall in a non-parallel manner.
